FAA WRBB NASET Tower Demolition at Warner-Robins AFB, GA

The WRBB NASET tower site is located on-airport at Warner Robins Air Force Base, leased by the FAA and was scheduled for restoration and return to original private or public landowners. The Titan scope of work was part of an overall decommissioning program, coordinated with follow on site demolition and restoration activities. The work consisted of dismantling and disposing of a tower, antennas, appurtenances, and miscellaneous concrete foundations on the Robins AFB. Prior to any on-site activities, we made the necessary arrangements for licenses, filings, permits, and payments. We also prepared all the necessary drawings, plans, and calculations required for the work. Titan performed minor grading and filling of holes/washouts in the access road to provide access for machinery and equipment.

Titan deconstructed an existing 125' tall self-support tower, cross members, and associated appurtenances. Titan removed and disposed of all existing antennas, ice bridge, guy wires, cable tray and other miscellaneous items attached to the tower. All work was performed in accordance with an approved demolition plan and a project specific / contractor approved risk mitigation plan.

Titan removed and disposed of concrete tower foundations, all waveguide bridge and concrete footings. Foundations and footings were removed to 1.5 ft. below grade level, backfilled with suitable backfill material, compacted, and erosion control installed. Titan disposed of all project waste material legally and provided documentation of proper disposal.

Titan submitted a project close out document at the end of the project. This document consisted of before and after photos of each work element, all permits and receipts collected, daily crew reports, inspection reports, safety procedures, and quality checklists.
