the Future

## FAA Tampa - NSG Tampa International Airport (TPA)

The TPA tower site is located on-airport at Tampa, FL. The scope for the tower project was to assess the tower and site conditions and provide information/measurements of the tower and related appurtenances in preparation for construction work on site or decommissioning the tower itself. The information recorded regards tower safety, structural member sizes, tower height, and section weights.

Tower measurements, including steel member thickness, were recorded for each member and appurtenance of the tower. These measurements were conveyed by an electronic report that also included detailed photographs and video of the tower and surrounding area.

A detailed report of this type is required prior to construction on or decommissioning of a tower and may consist of over 100 detailed weights and dimensions of tower members as well as 10's to hundreds of photographs with embedded text descriptions, GPS coordinates, compass direction, and altitude in each photograph to aid with the position and context of each photo.
